PROPUMPSIZER 2.0

SELECTION SOFTWARE

propumpsizer.com

“ProPumpSizer 2.0” is a new planning software that supports the user in selecting the right pump and other accessory components. ProPumpSizer combines an intelligently designed selection system with detailed product data and clearly structured calculations. A variety of new functions and always up-to-date data are just some of the many advantages this new tool offers. The user can select the right pump in different ways, based on the duty point, the application or the product name. The hydraulic selection determines the duty point, which can also be displayed graphically as part of the calculations. After selecting the pump type, the user is guided through various menus to select mechanical accessories and control-related components. In addition, the user receives suggestions for useful pump accessories based on the planned installation.

In addition to the detailed description of the components, performance data and characteristic curves, the software optionally generates a detailed quotation or an inquiry.

The integrated quotation software allows manual modification of prices and texts, and new user-defined items can be added if required. The user management system allows each registered user to select the specific functions he/she needs. The software is available in many different languages, besides German e.g. also English, French and Italian.
